Methodology

To compile the Software Rankings, respondents were asked to vote for their preferred software vendor, implementation specialist, data management firm and data provider in a variety of categories. All votes were carefully checked and invalid votes stripped out. Examples of votes considered invalid are people voting for their own firm or using a free internet-based email address, multiple votes from the same person or IP address, and voters who chose the same firm indiscriminately throughout the survey. Following closure of the poll, the results are subject to an internal review process, which can result in categories being dropped or aggregated if they do not have enough votes.

The results were then analysed and validated by Chartis Research using its RiskTech Quadrant methodology. This methodology has been developed specifically for the risk technology marketplace and takes into account vendors' product, technology and organisational capabilities using a variety of sources including evaluation forms, vendor briefings, end-user feedback and publicly available information.
